

S6 Fig. Tumor necrosis factor receptor superfamily member 12A (TNFRSF12A) affects proliferation of HT-29. (A) Quantitative real-time polymerase chain reaction to assess the mRNA levels of TNFRSF12A in the inducible TNFRSF12A knockdown or overexpression HT-29 colorectal cancer cells. The duration of Dox treatment was 48 hours. (B) Western blot to assess the protein levels of TNFRSF12A in the inducible TNFRSF12A knockdown or overexpression HT-29 colorectal cancer cells. The duration of Dox treatment was 48 hours. (C) Growth curves of HT-29 cell line with TNFRSF12A knockdown or overexpression. (D) Representative colony formation images of HT-29 cell line with TNFRSF12A knockdown or overexpression. Scale bar=5 mm.
